University

UAVs

Unmanned aerial vehicles (UAVs, also known as drones) have been widely used in the military field.

UAVs: From Military to Civil Applications

Due to technological **advances** drones have been used in **civil applications**.

- Critical Systems;

Software Evolution

Drone-based application may require constant **evolution**.

- Complex systems;
- Critical Systems;
- Dynamic and uncertain environment;

Self-adaptive system (SAS)

Increase the degree of autonomy with minimal interaction through **self-adaptation** techniques.

Self-adaptive drone

- Autonomous navigation;

Self-adaptive drone

- Autonomous navigation;

- Real-time control;
- Communication and connectivity;
- Response to faults.

Predefined situations

- The SAS may handle **predefined situations** designed at design time.

Uncertainties

- **Uncertainties** can happen at runtime causing **unexpected situations** and **risk to the mission**.

Sources of uncertainty

**Unavailable
internal/external
resources**

Sources of uncertainty

**Unavailable

Interaction with humans

Opportunity

Maximizing the drone's chances of achieving its **mission goals** over **uncertainties** is essential.

Approach

Handling unexpected situations by monitoring the system and environment and designing appropriate on-the-fly adaptation strategies to satisfy the goals of drone-based missions.

Overview

Expected Scenario Specification

Behavior-driven development

Expected Scenario Specification

Behavior-driven development

- Given (context);

Expected Scenario Specification

Behavior-driven development

- Given (context);
- When (event/trigger);

Expected Scenario Specification

Behavior-driven development

- Given (context);
- When (event/trigger);
- Then (outcome).

Expected Scenario Specification

Expected Scenario Specification

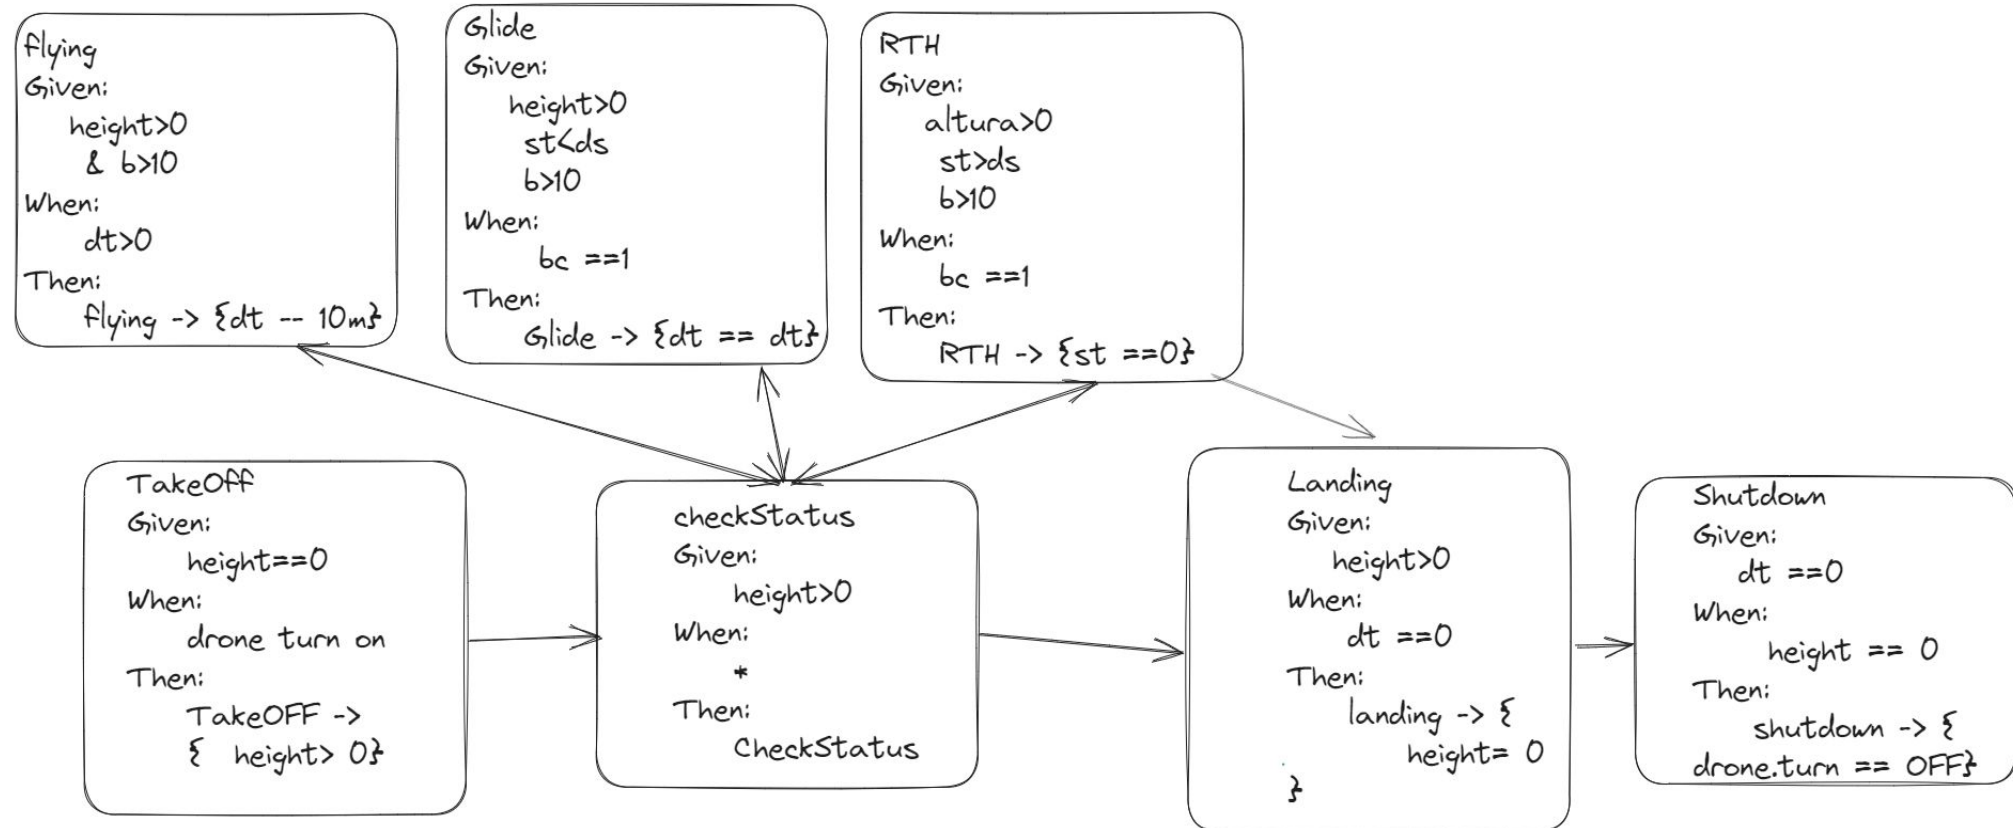

(Flying)

(Over destination)

(Landed at the destination)

```
Deliver
Given:
  drone.height > 0
When:
  drone.targetDist==0
Then:
  landing -> {
    drone.height = 0
    drone.targetDist=0
  }
```

Behavioral model

Detection & Identification Unexpected Situation

Detection & Identification of an US:

- When a **context** or **outcome** is not as expected.

Example

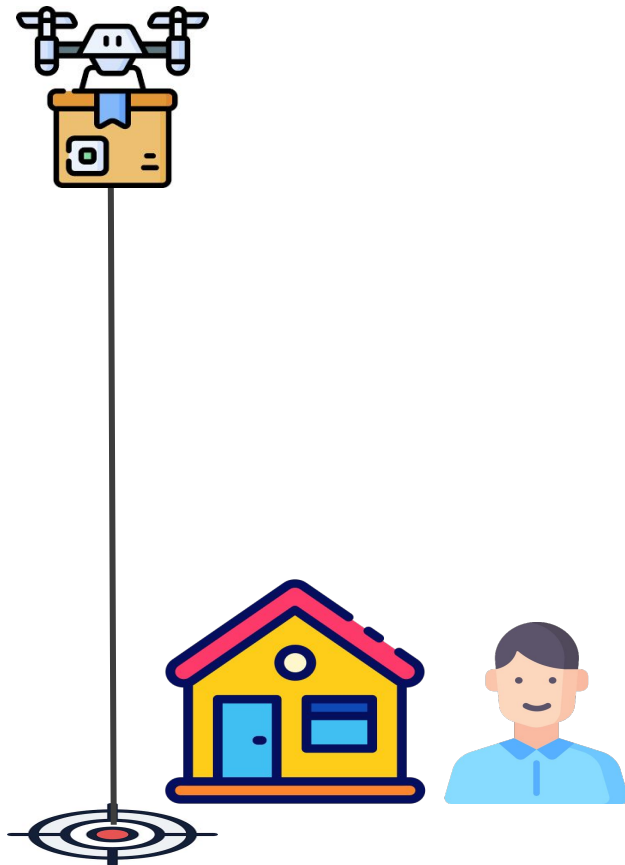

Example

Example

Example

Deliver

Given:

$$h > 0$$

When:

$$dt == 0$$

Then:

$$\text{landing} \rightarrow \{ \\ h = 0 \\ dt = 0 \}$$

Example

Deliver

Given:

$$h > 0$$

When:

$$dt == 0$$

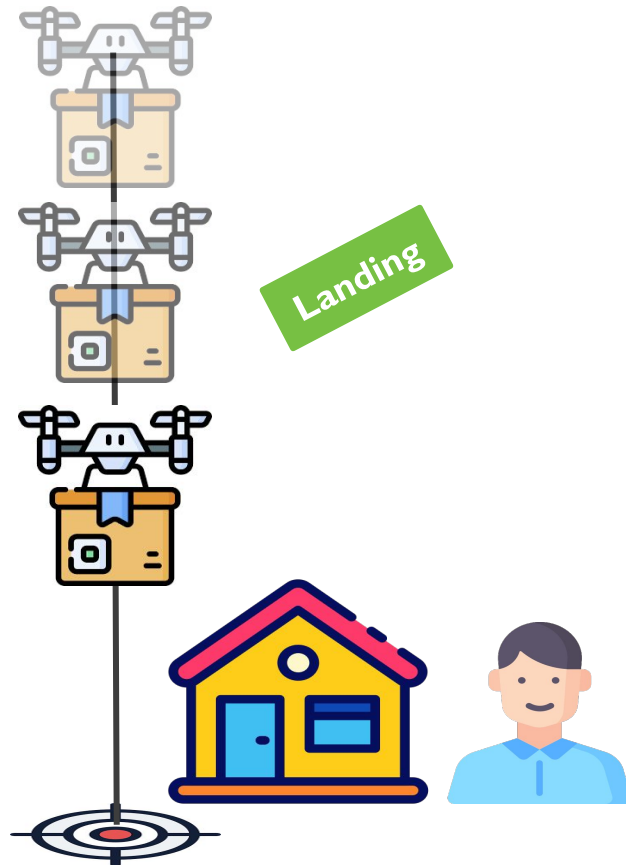

Then:

landing $\rightarrow \{$

$$h = 0$$

$$dt = 0 \}$$

Example

Deliver

Given:

$$h > 0$$

When:

$$dt == 0$$

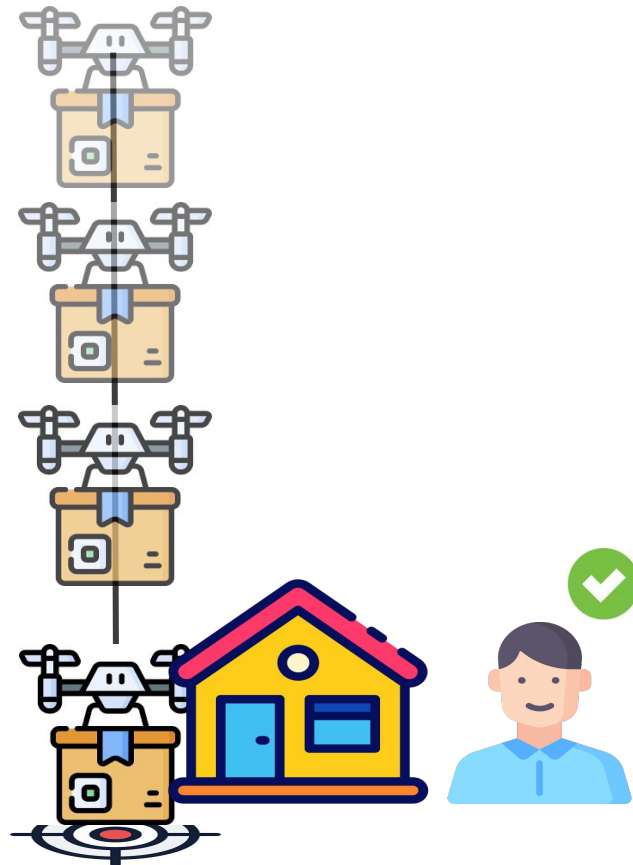

Then:

landing \rightarrow {

$$h = 0$$

$$dt = 0$$
 }

Example

Deliver ✓

Given:

$$h > 0$$

When:

$$dt == 0$$

Then:

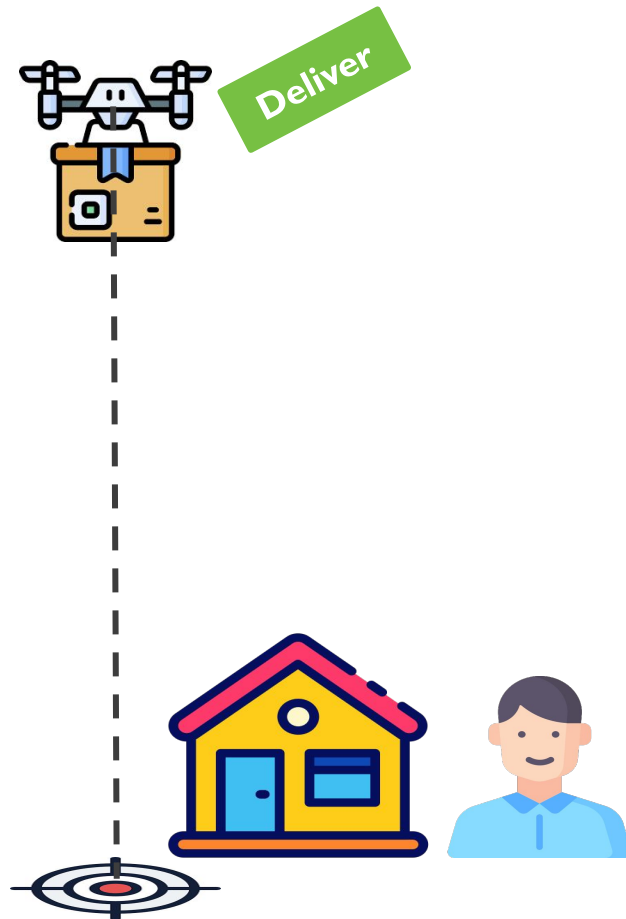

landing \rightarrow {

$$h = 0$$

$$dt = 0$$
}

Expected
scenario

Example

Deliver

Given:

$h > 0$

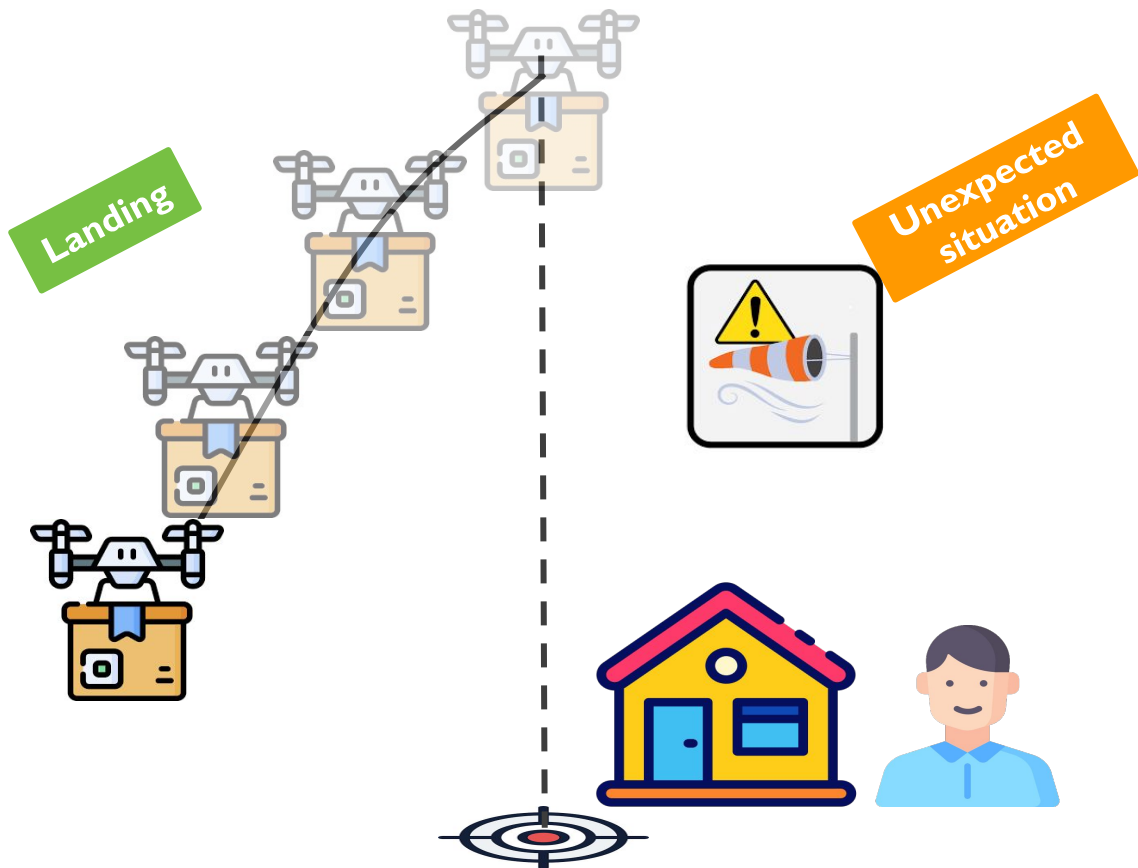

When:

$dt == 0$

Then:

landing \rightarrow $\{$
 $h = 0$
 $dt = 0$ $\}$

Example

Deliver

Given:

$$h > 0$$

When:

$$dt == 0$$

Then:

landing \rightarrow {

$$h = 0$$

$$dt = 0 \}$$

Example

Deliver

Given:

$$h > 0$$

When:

$$dt == 0$$

Then:

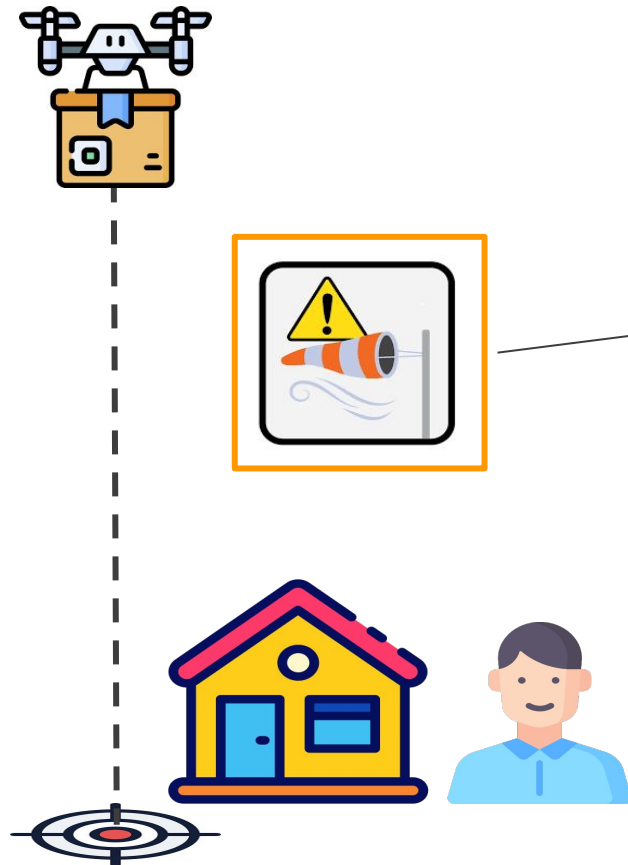

landing \rightarrow {

$$h = 0$$

$$dt = 0$$

Unexpected
scenario

Example

Deliver

Given:

$h > 0$ AND STRONG_WIND

When:

$dt == 0$

Then:

$\rightarrow \{$
 $h = 0$
 $dt = 0 \}$

Approach: Similarity-based adaptation

Similarity between scenarios (Work in progress)

Approach: Similarity-based adaptation

Similarity between scenarios

(Work in progress)

- Method that quantifies the **similarity** between **scenarios**.

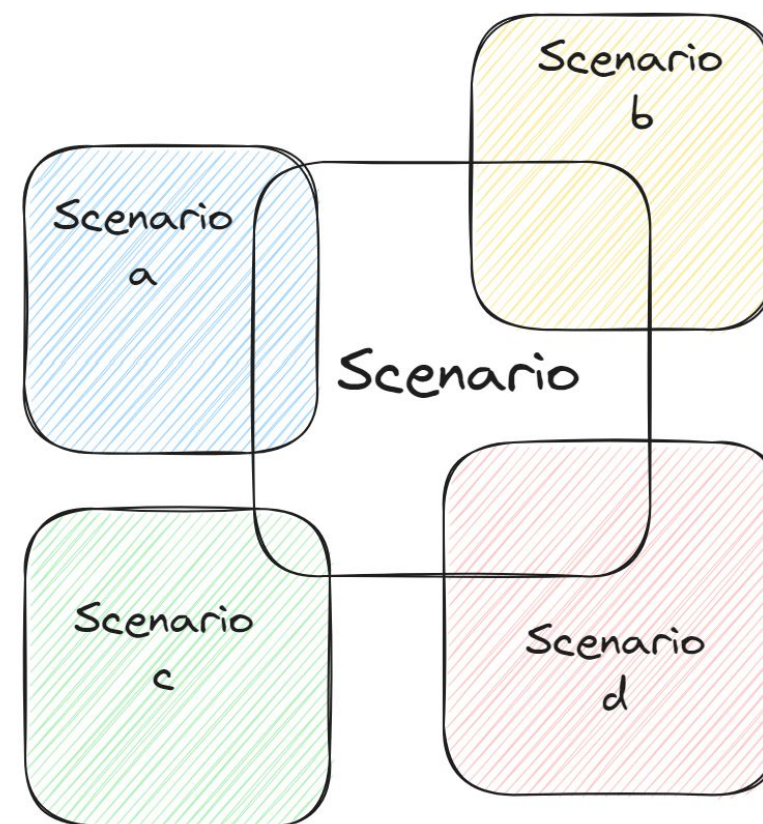

Approach: Similarity-based adaptation

Similarity between scenarios

(Work in progress)

- Method that quantifies the **similarity** between **scenarios**.
- Search for a scenarios that is **closer** to the **unexpected scenario** and that will enable the **mission to continue**.

Approach: Similarity-based adaptation

Deliver

Given:

$h > 0$ AND STRONG_WIND

When:

$dt == 0$

Then:

$\boxed{???} \rightarrow \{$
 $h = 0$
 $dt = 0 \}$

Approach: Similarity-based adaptation

RTH

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

```
Deliver
Given:
  h > 0 AND STRONG_WIND
When:
  dt == 0
Then:
  [ ] -> {
    h = 0
    dt = 0
  }
```

Approach: Similarity-based adaptation

RTH

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

RechargeLand

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

```
Deliver
Given:
  h > 0 AND STRONG_WIND
When:
  dt == 0
Then:
  [ ] -> {
    h = 0
    dt = 0
  }
```

STRONG_WIND

Approach: Similarity-based adaptation

RTH

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

RechargeLand

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

SafeLand

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

```
Deliver
Given:
  h > 0 AND STRONG_WIND
When:
  dt == 0
Then:
  ??? -> {
    h = 0
    dt = 0
  }
```

STRONG_WIND

Approach: Similarity-based adaptation

SafeLand

```
Given: var = 0
When var2 > -10
Then: xpto -> {
  var 3 = 0
}
```

Command

```
Deliver
Given:
  h > 0 AND STRONG_WIND
When:
  dt == 0
Then:
  ??? -> {
    h = 0
    dt = 0
  }
```

STRONG_WIND

Approach: Similarity-based adaptation

ADAPTED_Deliver

Deliver

Given:

$h > 0$ AND **STRONG_WIND**

When:

$dt == 0$

Then:

??? $\rightarrow \{$
 $h = 0$
 $dt = 0 \}$

SafeLand

Given: $var = 0$
When $var2 > -10$
Then: $xpto \rightarrow \{$
 $var\ 3 = 0$
 $\}$

Second Approach: Delegation-based adaptation

Delegation Strategy
(Work in progress)

Second Approach: Delegation-based adaptation

Delegation Strategy (Work in progress)

- When there is a **support network**.

Second Approach: Delegation-based adaptation

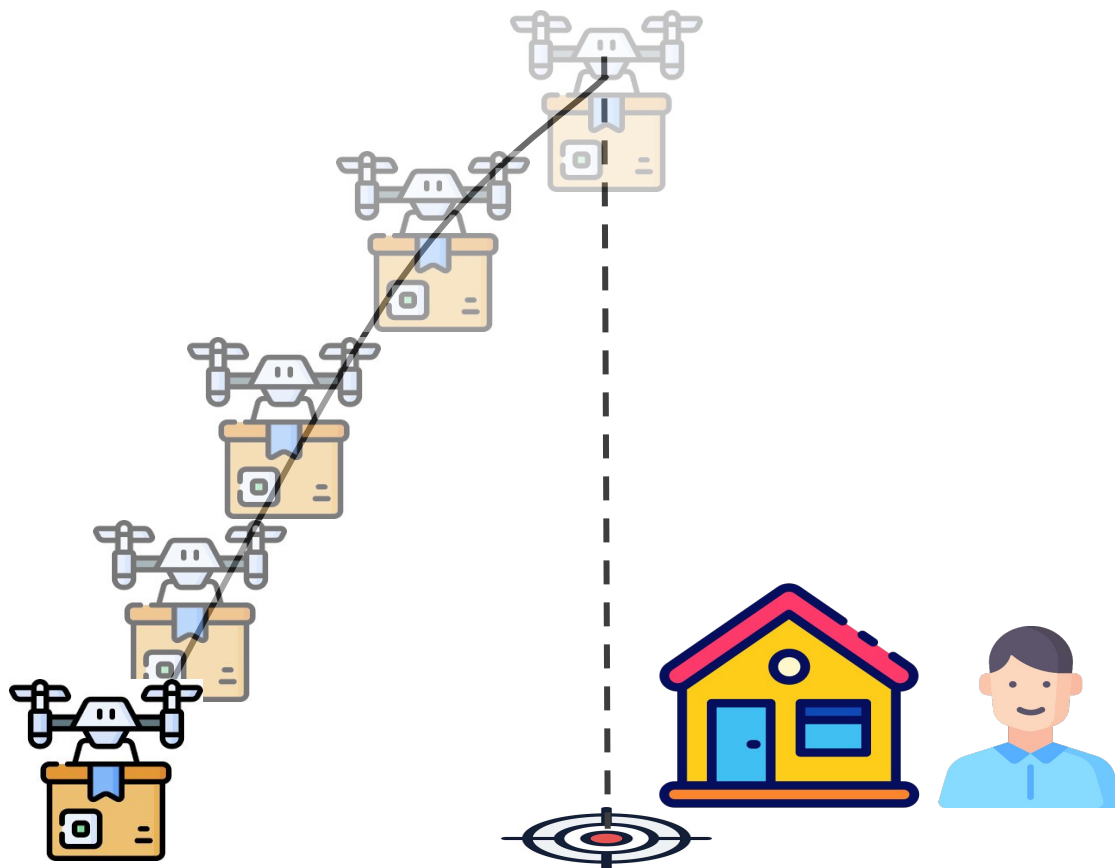

Delegation Strategy

(Work in progress)

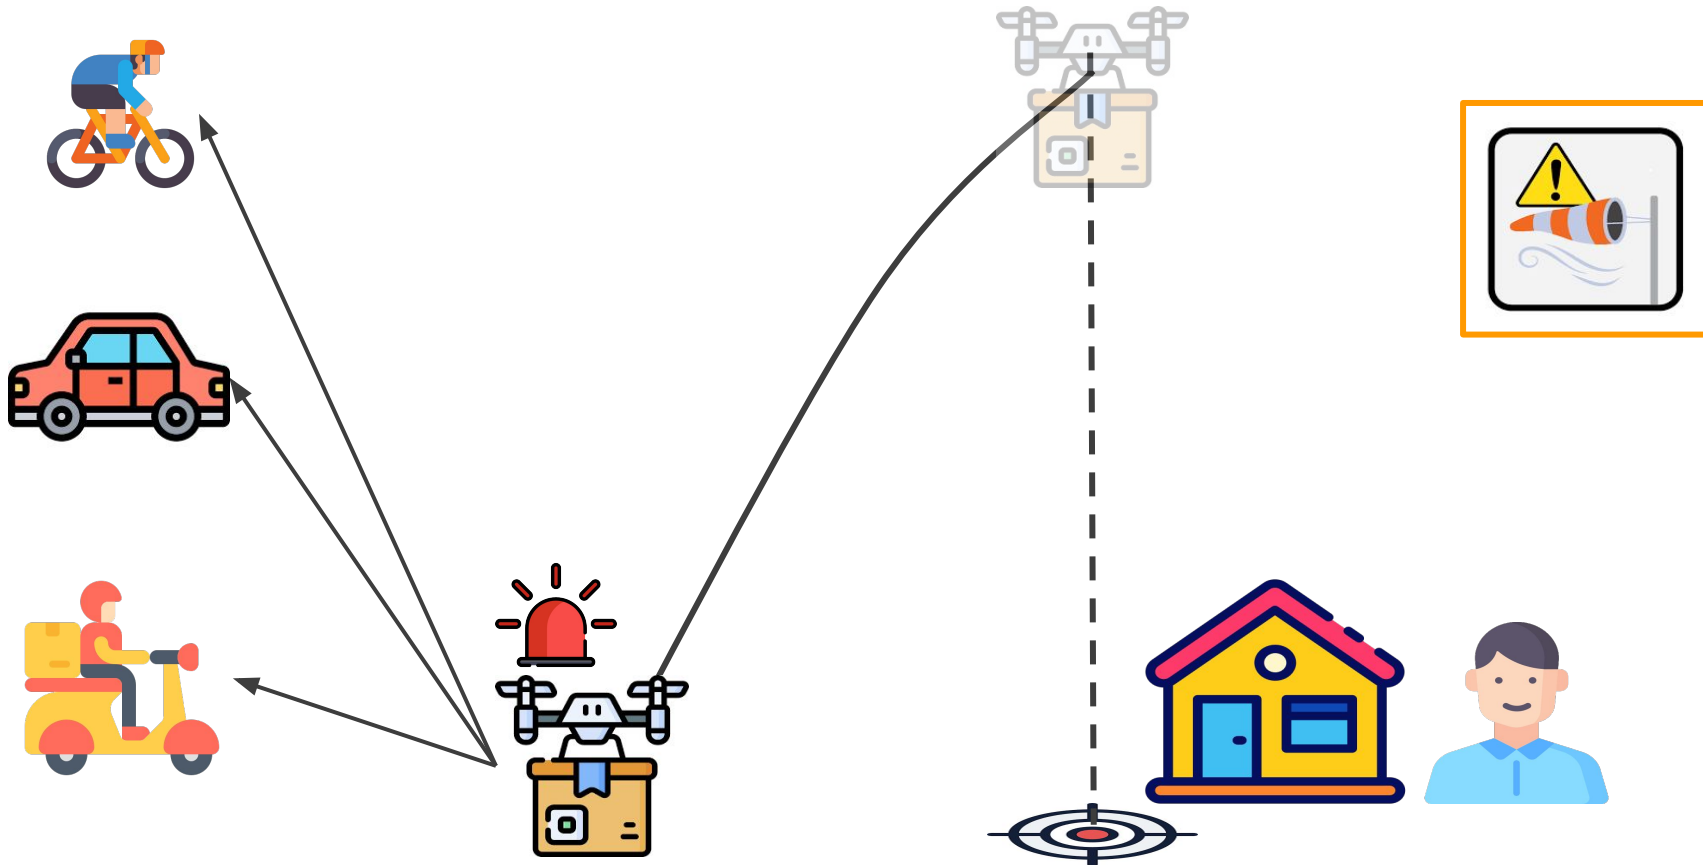

- When there is a **support network**.
- **Benefit-Cost Decision Making.**
